

Graphify: Step-by-Step Setup Guide

1. Prerequisites

Make sure you have:

- Python **3.10+** installed
 - pip available
 - An AI coding assistant (one of):
 - Claude Code
 - Codex
 - Cursor
 - Gemini CLI
 - GitHub Copilot CLI
 - VS Code Copilot Chat
-

2. Install Graphify

Run:

```
pip install graphifyy && graphify install
```

 Important:

- The correct package name is **graphifyy** (double **y**)
 - Other similarly named packages are not official
-

3. Platform-Specific Setup

Depending on your tool:

Claude Code

```
graphify install
```

Cursor

graphify cursor install

Codex

graphify install --platform codex

Gemini CLI

graphify install --platform gemini

GitHub Copilot CLI

graphify install --platform copilot

VS Code Copilot Chat

graphify vscode install

4. Run Graphify on Your Codebase

Navigate to your project folder and run:

```
/graphify .
```

For Codex:

```
$graphify .
```

This will generate:

```
graphify-out/  
├── graph.html  
├── GRAPH_REPORT.md  
├── graph.json  
└── cache/
```

5. Make Graph Always Available to AI (Recommended)

Run:

```
graphify claude install
```

Or equivalent for your platform:

```
graphify cursor install  
graphify codex install  
graphify gemini install
```

This ensures:

- AI reads graph before searching files
 - Better architectural understanding
 - **Reduced token usage**
-

6. Ignore Unnecessary Files

Create a `.graphifyignore` file:

```
node_modules/  
dist/  
vendor/  
*.generated.py
```

7. Query Your Graph

Examples:

```
graphify query "show auth flow"  
graphify query "what connects X to Y"  
graphify path "A" "B"  
graphify explain "SomeConcept"
```

8. Give context to Agent

Prompt (Paste as it is in agent, just update the GRAPHIFY_OUT_PATH) :

You have access to a Graphify knowledge graph at:

<GRAPHIFY_OUT_PATH>

For every question:

1. First run:

graphify query "<user question>" --graph <GRAPHIFY_OUT_PATH>/graph.json

2. Use ONLY the returned graph context to answer.

3. If the graph context is insufficient, then (and only then) read specific files.

Rules:

- Do NOT scan the entire codebase
- Do NOT load full files unless absolutely necessary
- Prefer relationships, dependencies, and paths from the graph
- Cite source files mentioned in the graph output when possible

How to Keep Growing the Graph

Graphify becomes more powerful as your corpus grows. To continuously improve it:

- **Re-run periodically**
graphify .
This updates the graph with new files and changes.
- **Add more context sources** Include:
 - Docs (.md, .txt)
 - PDFs (papers, specs)
 - Screenshots / diagrams
 - Notes / raw ideas
- **Use add for external knowledge**
graphify add <url>
Example: papers, blogs, tweets, videos
- **Keep raw knowledge folder** Maintain something like:
/raw
Drop everything there → Graphify connects it
- **Use update instead of full rebuild (faster)**
graphify update ./

- **Think in signals, not files** The graph improves when you add:
 - reasoning
 - comments
 - architectural decisions

Over time, your graph becomes a **persistent memory layer** for all agents, not just a one-time analysis.
